

Solutions to Pathria's Statistical Mechanics

Chapter 1

SM-at-THU

January 20, 2019

Problem 1.1

$$\ln \Omega^{(0)}(E^{(0)}, E_1) = \ln \Omega(E_1) = \ln(\Omega_1(E_1)\Omega_2(E_2)) \quad (1)$$

We can expand $\ln \Omega_1(E_1)$ and $\ln \Omega_2(E_1)$ into series near \bar{E}_1 , and the leading terms are

$$\ln \Omega_1(E_1) = \ln \Omega_1(\bar{E}_1) + \left. \frac{\partial \ln \Omega_1(E_1)}{\partial E_1} \right|_{E_1=\bar{E}_1} (E_1 - \bar{E}_1) + \frac{1}{2} \left. \frac{\partial^2 \ln \Omega_1(E_1)}{\partial E_1^2} \right|_{E_1=\bar{E}_1} (E_1 - \bar{E}_1)^2 + \dots \quad (2)$$

$$\ln \Omega_2(E_1) = \ln \Omega_2(\bar{E}_1) + \left. \frac{\partial \ln \Omega_2(E_1)}{\partial E_1} \right|_{E_1=\bar{E}_1} (E_1 - \bar{E}_1) + \frac{1}{2} \left. \frac{\partial^2 \ln \Omega_2(E_1)}{\partial E_1^2} \right|_{E_1=\bar{E}_1} (E_1 - \bar{E}_1)^2 + \dots \quad (3)$$

We can set the complicated derivatives to simple symbols

$$\left. \frac{\partial \ln \Omega_1(E_1)}{\partial E_1} \right|_{E_1=\bar{E}_1} = a_1 \quad (4)$$

$$\left. \frac{\partial \ln \Omega_2(E_1)}{\partial E_1} \right|_{E_1=\bar{E}_1} = a_2 \quad (5)$$

$$\left. \frac{\partial^2 \ln \Omega_1(E_1)}{\partial E_1^2} \right|_{E_1=\bar{E}_1} = b_1 \quad (6)$$

$$\left. \frac{\partial^2 \ln \Omega_2(E_1)}{\partial E_1^2} \right|_{E_1=\bar{E}_1} = b_2 \quad (7)$$

$$\ln \Omega(E_1) = \ln(\Omega_1(\bar{E}_1)\Omega_2(\bar{E}_1)) + (a_1 + a_2)(E_1 - \bar{E}_1) + \frac{b_1 + b_2}{2}(E_1 - \bar{E}_1)^2 + \dots \quad (8)$$

This function reaches its maximum under thermodynamic equilibrium condition at $E_1 = \bar{E}_1$. Thus the linear term must vanish.

$$\ln \Omega(E_1) = \ln(\Omega_1(\bar{E}_1)\Omega_2(\bar{E}_1)) + \frac{b_1 + b_2}{2}(E_1 - \bar{E}_1)^2 + \dots \quad (9)$$

$$\approx \frac{b_1 + b_2}{2}(E_1 - \bar{E}_1)^2 + \ln(\Omega(\bar{E}_1)) \quad (10)$$

$$\Omega(E_1) = e^{(b_1+b_2)(E_1-\bar{E}_1)^2 + \ln(\Omega(\bar{E}_1))} = A e^{\frac{b_1+b_2}{2}(E_1-\bar{E}_1)^2} \quad (11)$$

$$A = e^{\ln(\Omega(\bar{E}_1))} \quad (12)$$

Which is obviously a gaussian function.

Gaussian RMS can be easily determined to be

$$\frac{1}{2(b_1 + b_2)} = \frac{1}{2} \frac{1}{\left(\frac{\partial \beta_1}{\partial E_1} + \frac{\partial \beta_2}{\partial E_2}\right)} = \frac{1}{2} \frac{1}{\frac{1}{kT_1^2 C_{v1}} + \frac{1}{kT_2^2 C_{v2}}} \quad (13)$$

For the example of ideal classical gases, we can substitute $C_{vi} = \frac{3}{2}N_i k$ and obtain $\frac{3}{2}k^2 T^2 \frac{N_1 N_2}{N_1 + N_2}$

Problem 1.2

Utilizing the additive characteristic of $S = f(\Omega)$ and get

$$S = S_1 + S_2 = f(\Omega_1) + f(\Omega_2) \quad (14)$$

$$\left(\frac{dS}{d\Omega_1}\right)_{\Omega_2} = f'(\Omega_1) \quad (15)$$

$$\left(\frac{dS}{d\Omega_2}\right)_{\Omega_1} = f'(\Omega_2) \quad (16)$$

Inspect a small pertubation near the equilibrium state using the fact that $S = f(\Omega) = f(\Omega_1 \Omega_2)$

$$\left(\frac{dS}{d\Omega_1}\right)_{\Omega_2} = \lim_{\Delta \rightarrow 0} \frac{f((\Omega_1 + \Delta)\Omega_2) - f(\Omega_1 \Omega_2)}{\Delta} \quad (17)$$

Assume that $\delta = \Delta \Omega_2$

$$\left(\frac{dS}{d\Omega_1}\right)_{\Omega_2} = \lim_{\Delta \rightarrow 0} \Omega_2 \frac{f(\Omega_1 \Omega_2 + \Delta \Omega_2) - f(\Omega_1 \Omega_2)}{\Delta \Omega_2} = \lim_{\delta \rightarrow 0} \Omega_2 \frac{f(\Omega + \delta) - f(\Omega)}{\delta} = \Omega_2 f'(\Omega) \quad (18)$$

Apply to $\left(\frac{dS}{d\Omega_2}\right)_{\Omega_1}$, we can get similar result.

$$\left(\frac{dS}{d\Omega_2}\right)_{\Omega_1} = \Omega_1 f'(\Omega) \quad (19)$$

Finally,

$$f'(\Omega_1) = \Omega_2 f'(\Omega) = \frac{\Omega_2}{\Omega_1} f'(\Omega_2) \quad (20)$$

$$\Omega_1 f'(\Omega_1) = \Omega_2 f'(\Omega_2) \quad (21)$$

It is obvious that this equation holds for all Ω . Set the value of the equation constant k .

$$\Omega \frac{df(\Omega)}{d\Omega} = k \quad (22)$$

$$f(\Omega) = k \ln \Omega + C \quad (23)$$

Using a special value $\Omega = 1$

$$f(\Omega * 1) = f(\Omega) + f(1) \quad (24)$$

$$C = f(1) = 0 \quad (25)$$

And get the result

$$S = f(\Omega) = k \ln \Omega \quad (26)$$

Problem 1.3

When the two systems are brought together, they can form an isolated system. Energy and particle number are constant while entropy will not not decreasing in such a system.

$$E_A + E_B = E_0 \quad (27)$$

$$N_A + N_B = N_0 \quad (28)$$

$$dS_A + dS_B \geq 0 \quad (29)$$

Apply derivation and get

$$dE_A + dE_B = 0 \quad (30)$$

$$dN_A + dN_B = 0 \quad (31)$$

$$dS_A + dS_B \geq 0 \quad (32)$$

Substitute these relations into equation

$$dE_A = T_A dS_A - p_A dV_A + \mu_A dN_A \quad (33)$$

$$dE_B = T_B dS_B - p_B dV_B + \mu_B dN_B \quad (34)$$

$$dV_A = 0 \quad (35)$$

$$dV_B = 0 \quad (36)$$

and get

$$\frac{dE_A}{dN_A} \geq \frac{\mu_A T_B - \mu_B T_A}{T_B - T_A} \quad (37)$$

Problem 1.4

Suppose N is the number of particles, v_0 is the volume occupied by one particle and therefore the total number of microstates Ω is

$$\Omega = \frac{1}{N!} \left(\frac{V}{8v_0} \right) \dots \left(\frac{V}{8v_0} - N + 1 \right) \quad (38)$$

The “8” comes from the geometrical configurations that two particle cannot be too close, i.e the distance between two particles is larger than $2r$. Following (1.4.2), we have

$$\frac{P}{T} = k \left(\frac{\partial \ln \Omega}{\partial V} \right)_{N,E} \quad (39)$$

$$= k \frac{\partial \Omega}{\Omega \partial V} \quad (40)$$

$$= k \frac{N}{V} \left(1 + \frac{8(N-1)v_0}{2V} + \dots \right) \quad (41)$$

Considering only the first two terms, it corresponds to $P(V - b) = NkT$ with $b = 4Nv_0$.

Problem 1.5

Using equation (A.11), and setting $K = \pi\sqrt{\varepsilon}/L$, it is straight forward to achieve

$$\Sigma_1(\varepsilon) = \frac{\pi}{6}\varepsilon^{3/2} \pm \frac{3\pi}{8}\varepsilon \quad (42)$$

where the first term is the volume term ($V = L^3$) and the next one is the surface correction ($S = 6L^2$).

Problem 1.6

Use the formula for ideal gas $PV = NkT$.

$$Nk \times 300 = 10^5 \times \frac{\pi}{10} \quad (43)$$

Thus $\Delta T = 10^4/Nk \sim 955K$.

Problem 1.7

If the energy have follow extreme relativistic form. We can learn from 1.4.

$$S(N, E, V) = S(N, \epsilon^2 V^{\frac{2}{3}})$$

Hence, for the constancy of S and N, which defines a reversible adiabatic process.

$$\epsilon^2 V^{\frac{2}{3}} = const$$

Pressure could be inferred by

$$P = -\left(\frac{\partial E}{\partial V}\right)_{N,S}$$

So we can get the adiabatic equation.

$$PV^{\frac{4}{3}} = const$$

So the adiabatic exponent $\frac{C_p}{C_v} = \frac{4}{3}$

Problem 1.8

We use n_i to show the number of quasiparticles in the n_{th} energy state, and we can derive:

$$\sum_{i=0}^{+\infty} n_i = N$$

$$\sum_{i=0}^{+\infty} n_i \epsilon_i = E$$

We use the partition function of canonical system.

$$Z = \sum_{i=0}^{+\infty} g_i e^{\frac{\epsilon_i}{kT}}$$

$$P_i = \frac{e^{\frac{\epsilon_i}{kT}}}{Z}$$

finally you can get the T

$$T = \frac{h\nu}{k \ln(1 + \frac{N h \nu}{E})}$$

Problem 1.9

According that S is an extensive quantity. So S is a linear function.

$$S = aN + bV + cE$$

$$a = \left(\frac{\partial S}{\partial N}\right)_{V,E}, b = \left(\frac{\partial S}{\partial V}\right)_{N,E}, c = \left(\frac{\partial S}{\partial E}\right)_{V,N}$$

So

$$N\left(\frac{\partial S}{\partial N}\right)_{V,E} + V\left(\frac{\partial S}{\partial V}\right)_{N,E} + E\left(\frac{\partial S}{\partial E}\right)_{V,N} = S$$

Problem 1.10

Just use equation (1.4.21) and (1.4.23), we have:

$$S(N, V, E) = Nk \ln \left[V \left(\frac{2\pi mkT}{h^2} \right)^{3/2} \right] + \frac{3}{2}Nk \quad (44)$$

Since He and Ar have the same N, V . We can get the T that He and Ar have the same entropy:

$$T = 0K(?)$$

Problem 1.11

As N_2 and O_2 are mixed together at the same pressure and temperature, we can know that the volume of mixed gas is: $V = V_1 + V_2$. And we can get the entropy of mixing by utilizing equation (1.5.3):

$$\Delta S = k \left[N_1 \ln \frac{V}{V_1} + N_2 \ln \frac{V}{V_2} \right] \quad (45)$$

for per mole of the air formed:

$$\begin{aligned} \Delta S_n &= k \left[N_1 \ln \frac{V}{V_1} + N_2 \ln \frac{V}{V_2} \right] / (n_1 + n_2) \\ &= R \left[n_1 \ln \frac{V}{V_1} + n_2 \ln \frac{V}{V_2} \right] / (n_1 + n_2) \\ &= 4.16 \text{ J} \cdot \text{mol}^{-1} \cdot \text{K}^{-1} \end{aligned} \quad (46)$$

Problem 1.12

(a) Equation (1.5.3a) can be written as:

$$\begin{aligned} (\Delta S)_{1 \equiv 2} &= N_1 \ln \frac{(V_1 + V_2)N_1}{V_1(N_1 + N_2)} + N_2 \ln \frac{(V_1 + V_2)N_2}{V_2(N_1 + N_2)} \\ &= (N_1 + N_2) \left[y \ln \frac{y}{x} + (1 - y) \ln \frac{1 - y}{1 - x} \right] \end{aligned} \quad (47)$$

Here $x = V_1/(V_1 + V_2)$, $y = N_1/(N_1 + N_2)$.

Consider the function $f(x, y) = y \ln \frac{y}{x}$, we can get the second derivatives:

$$D^2 f(x, y) = \begin{bmatrix} y/x^2 & -1/x \\ -1/x & 1/y \end{bmatrix} \quad (48)$$

Since $D^2 f(x, y)$ is a positive-semidefinite, $f(x, y)$ is a convex function. Then we can know that:

$$\frac{1}{2}f(x, y) + \frac{1}{2}f(1-x, 1-y) \geq f(1/2, 1/2) = 0 \quad (49)$$

This means $(\Delta S)_{1 \equiv 2} \geq 0$ and the equality holding only when $N_1/V_1 = N_2/V_2$

(b) Suppose that $N = N_1 + N_2$. And we have $(\Delta S)^*$ by utilizing equation (1.5.4) :

$$\begin{aligned} (\Delta S)^* &= k \left[N_1 \ln \frac{N}{N_1} + N_2 \ln \frac{N}{N_2} \right] \\ &= k [N \ln N - N_1 \ln N_1 - N_2 \ln N_2] \end{aligned} \quad (50)$$

Then we have the derivative of $(\Delta S)^*$ with respect to N_1 :

$$\begin{aligned} \frac{d(\Delta S)^*}{dN_1} &= -\ln N_1 - \frac{\partial N_2}{\partial N_1} \ln N_2 \\ &= -(\ln N_1 - \ln N_2) \end{aligned} \quad (51)$$

It shows that $\frac{d(\Delta S)^*}{dN_1}$ satisfies:

$$\frac{d(\Delta S)^*}{dN_1} \begin{cases} < 0 & N_1 > N_2 \\ = 0 & N_1 = N_2 \\ > 0 & N_1 < N_2 \end{cases} \quad (52)$$

So we can know that $(\Delta S)^*$ have the only maximum value at $N_1 = N_2$:

$$\max (\Delta S)^* = (N_1 + N_2 \ln 2) \quad (53)$$

Then we get:

$$\max (\Delta S)^* \leq (N_1 + N_2 \ln 2) \quad (54)$$

The equality holding when and only when $N_1 = N_2$

Problem 1.13

In both cases the entropy will increase, but the increment of different gases mixing is larger. You can check that with the equations in *Section 1.5* and I don't want to type it again, for entropy-saving's sake:)

Problem 1.14

$$(\Delta S)_V = \frac{3Nk}{2} \ln \left(\frac{T_2}{T_1} \right) \quad (55)$$

While fixing p , $V_2/V_1 = T_2/T_1$.

$$(\Delta S)_p = Nk \ln \left(\frac{V_2}{V_1} \right) + \frac{3Nk}{2} \ln \left(\frac{T_2}{T_1} \right) = \frac{5Nk}{2} \ln \left(\frac{T_2}{T_1} \right) \quad (56)$$

Clealy, $(\Delta S)_p = 5/3(\Delta S)_V$.

Problem 1.15

From $V_1 \rightarrow V_2$, we have

$$\frac{p_{2a}}{p_{1a}} = \frac{V_1^{\gamma_1}}{V_2^{\gamma_1}} \quad (57)$$

$$\frac{p_{2b}}{p_{1b}} = \frac{V_1^{\gamma_2}}{V_2^{\gamma_2}} \quad (58)$$

$$\frac{p_2}{p_1} = \frac{V_1^\gamma}{V_2^\gamma} \quad (59)$$

where $p_{1a} = f_1 p_1$ and $p_{2a} = f_2 p_1$. After some algebra it's straightforward to see

$$\frac{1}{\gamma - 1} = \frac{f_1}{\gamma_1 - 1} + \frac{f_2}{\gamma_2 - 1} \quad (60)$$

Problem 1.16

Theorem:

If $f(x, y, z) = 0$, then we have

$$\left(\frac{\partial x}{\partial y} \right)_z \left(\frac{\partial y}{\partial x} \right)_z = 1$$

$$\left(\frac{\partial x}{\partial y} \right)_z \left(\frac{\partial y}{\partial z} \right)_x \left(\frac{\partial z}{\partial x} \right)_y = -1$$

(a)

$$\frac{S}{N} = - \left(\frac{\partial \mu}{\partial T} \right)_P$$

$$\frac{V}{N} = \left(\frac{\partial \mu}{\partial P} \right)_T$$

$$\frac{S}{V} = - \frac{\left(\frac{\partial \mu}{\partial T} \right)_P}{\left(\frac{\partial \mu}{\partial P} \right)_T} = - \frac{1}{\left(\frac{\partial T}{\partial \mu} \right)_P \left(\frac{\partial \mu}{\partial P} \right)_T} = \left(\frac{\partial P}{\partial T} \right)_\mu$$

(b)

$$\frac{V}{N} = \left(\frac{\partial \mu}{\partial P} \right)_T$$

$$V \left(\frac{\partial P}{\partial \mu} \right)_T = N$$
